Yeah, I think or something like that, like we give them the thesis and the final mini...

Yeah. The barrier isn't ability — it's **permission**. They're so trained to write...

Yeah, actually I'm thinking of something like that. Like the thesis and the mini...

Yeah I get it exactly. The thesis and mini conclusion give them the destination. But...

But how do we market this? I mean this is our unique selling point, but how do we...

That's actually a really clean USP to market because it's **tangible and provable**....

Then comes the organizing. Fuck.

Haha yeah organizing is the hard one. Same question as reasoning though — righ...

What do you mean by woven into the reasoning exercise?

Like — when the user writes their rough reasoning in the reasoning exercise, the...

Also previously the depth I mean was the hierarchy of information. So that means...

Yeah exactly. The rough sketch-out is flat by nature — they're just getting ideas out...

Isn't that just a feedback loop?

Yeah you're right. That's just the essay feedback feature we already have — write...

for vocabulary exercise, gimme 1 example

Đây rồi. Cùng layout hai cột — bên trái là ngữ cảnh và câu thô, bên phải là chọn t...

Okay, so after a while I have decided to do something different. I will still keep the new newsletter project but right now I am thinking of separating them into like merging them into one phase. Like okay I will release the voca the writing and speaking app but at once I will also release the news net newsletter. The difference is that I will have two dedicated accounts for these two things. My personal brand would be for yeah the newsletter which is fit much more better for newsletter. But then for the website I think for the app, writing beauty and speaking beauty I think I'm gonna go for a dedicated account. So yeah, that's that's what I think. So maybe we should work on the these two projects right now, the both the writing and speaking. But how you think about my idea?

16:41:54 20/6/2026

Used tool ▾

🔗 Searching project

🕒 Done

Okay, I've got the full context. Let me think through your idea honestly.

The core idea is solid. Two accounts, two audiences, two brand voices — that's a clean separation that actually makes strategic sense:

- **Personal brand (Pham Thao Chi)** → newsletter, teaching philosophy, Threads presence. This is where trust and depth live. People follow *you* here.
- **Product brand (Writing Beauty / Speaking Beauty)** → app-focused, feature-driven, more functional. People follow this for the tool, not the person behind it.

The parallel launch is also smarter than it sounds on first read. The original "newsletter first → app later" logic was about pain installation — getting people to *feel* the problem before the product arrives. That still works even if you launch both simultaneously, as long as the newsletter is doing its job in the weeks/months *before* the app is feature-complete enough to be useful. So the sequencing isn't necessarily broken.

One thing worth thinking through though: right now the newsletter's whole purpose was to warm up an audience *for* the Writing Builder. If they're launching together, the newsletter loses some of its "inevitability" function — people won't have had time to accumulate the "I didn't see that was wrong" moments that make the app feel like a solution they already need. You'd want to make sure you're starting the newsletter early enough that there's a real gap before the app is actually usable, even if both are technically "launched."

What I'd push back on slightly: do you actually have enough bandwidth to build both apps well at the same time? Writing Beauty and Speaking Beauty are pretty different product problems — one is about argument architecture, the other is about fluency and spontaneity. The risk is doing both at 70% instead of one at 100%.

So — what's prompting the shift? Is it a timeline thing, a monetization thing, or did the original sequencing just stop feeling right?

16:42:09 20/6/2026

I mean actually I believe that the audience has already aware of that writing needs reasoning and good vocabulary. I think they are all aware of it. They they they they they they they they they they they know that they need okay they need um content and they need to polish the content. I know they can be all aware of it but I think the the only problem they got they are not aware of it just the structured stuff and we will maybe like mm integrate this structured stuff into these two things by feedback. Like okay we'll feedback them on the structure like we woven it into the process of on the angle of like argument and polishing, you know what I mean right?

16:43:54 20/6/2026

Yeah, I get what you're saying. The audience already knows the two obvious layers — you need a good argument, and you need good language. What they're blind to is the middle layer: **structure**. How information flows, how sentences connect, how the whole thing holds together as a reading experience.

So instead of teaching structure explicitly (which is what the newsletter was originally designed to do), you weave the structural feedback *into* the app experience — it surfaces naturally when they're working on argument or polishing language. They don't need to know it's called "thematic progression," they just see "this sentence feels disconnected from the previous one, here's why."

That's actually a really elegant move. Structure becomes invisible scaffolding inside the product, not a separate thing to learn upfront.

This does change the newsletter's job though. If the app is handling the structural education through feedback, the newsletter doesn't need to do pain installation around structure anymore. So what does the newsletter do? A few possibilities:

- It becomes more about **teaching philosophy** — why top-down assessment matters, why most feedback is wrong
- It becomes **case studies** — real essays, real breakdowns, for people who want depth beyond the app

- It becomes a **trust builder** for your personal brand, not a product funnel

Which actually fits the two-account split even better. The newsletter under your personal brand is about *you and your ideas*, not about selling the app.

Does that land with what you're thinking?

16:44:03 20/6/2026

yep. how should i position my brand and the voice of my brand and all that

16:45:08 20/6/2026

Before I answer, let me ask a few things to make sure I give you something actually useful rather than generic brand advice.

16:45:14 20/6/2026

Q: Who are you primarily talking to on your personal brand?

A: maybe for those who want to practice writing + for teachers to let their students to practice

Q: What do you want people to feel after reading your content? (Select all that apply)

A: since this is a dedicated brand, there should not be any person behind it, i want it to have this calm effect idk maybe we should talk abt it later

Q: What's your biggest hesitation about putting yourself out there as a personal brand?

A: this is a company brand not a personal brand, i just feel like personal brand is not as trustworthy as it

16:47:27 20/6/2026

Okay, that's a really important clarification — you're not building a personal brand at all. You want **two company/product brands**:

1. **The newsletter brand** — calm, editorial, educational
2. **The app brand (Writing Beauty / Speaking Beauty)** — product-focused

And your hesitation makes sense. Personal brands in the IELTS space in Vietnam are everywhere — every teacher has a face and a following. A faceless, well-designed brand actually *stands out* because it signals "this is a product, not a personality cult." It also scales better — you're not the bottleneck.

But here's the tension worth naming: a faceless brand is harder to build trust with from zero, especially in Vietnam where people buy from people they know. The way most successful faceless edtech brands solve this is through **the quality of the content itself** — the writing, the design, the thinking. The brand *is* the standard it holds.

So the real question becomes: **what's the brand name, what does it stand for, and what's the consistent feeling across everything it puts out?**

Before we go further — are the names "Writing Beauty" and "Speaking Beauty" already decided, or are those still placeholder? And is the newsletter a separate brand name entirely, or under the same umbrella?

Because the naming architecture affects everything else.

16:47:35 20/6/2026

i can literally say that this is a product founded by me and my team, that's it
the newsletter is my personal brand. the apps r not

16:48:25 20/6/2026

Oh okay, I misread — so it IS a personal brand for the newsletter, just not a "look at me" influencer-style one. More like a writer/thinker who happens to have built something.

So the split is actually:

- **Newsletter = Pham Thao Chi** — your name, your voice, your thinking. The "founded by me" story lives here.
- **Writing Beauty / Speaking Beauty** — product brands, you're the founder but it's not centered on you.

That's a clean and honest structure. A lot of respected educational brands work exactly this way — the person is findable and real, but the content does the talking, not the personality performance.

So for your personal brand specifically — the newsletter under your name — the positioning question is simpler than full brand strategy. It's really just: **what is Pham Thao Chi's point of view that no one else in the Vietnamese IELTS space is saying out loud?**

From everything we've built together, I'd say you already have it:

Most IELTS feedback fixes the wrong thing. You don't have a vocabulary problem. You have a thinking problem.

That's your POV. Sharp, slightly contrarian, but not arrogant — because it's grounded in real diagnostic work, not just opinion.

Does that feel true to how you'd describe your own perspective? Or is there a sharper / different way you'd put it?

16:48:33 20/6/2026

freak, pham thao chi is just a reference. my name is not pham thao chi

16:50:05 20/6/2026

Haha sorry about that — I mixed up the brand name and your actual name. So Pham Thao Chi is the newsletter brand, not you personally.

So back to what you said earlier — the newsletter IS a personal brand in the sense that there's a real person (you) behind it, you're just not leading with your name. Pham Thao Chi is the pen name / brand name you write under.

That actually changes nothing about the positioning though. The POV I described still holds:

Most IELTS feedback fixes the wrong thing. You don't have a vocabulary problem. You have a thinking problem.

That's Pham Thao Chi's voice and perspective — warm, direct, slightly contrarian, grounded in real diagnostic work. The person behind it is real, just not the focus.

So — does that POV feel right to you? And do you want to work on the newsletter brand (Pham Thao Chi) first, or the app brand (Writing Beauty / Speaking Beauty)?

16:50:10 20/6/2026

NO, pham thao chi is another ppl, she has nothing to deal with this product. the newsletter hasnt been named. dont focus too much on this shitty naming stuff. the newsletter stuff has already been decided. now we got to work on the speaking & writing

16:51:29 20/6/2026

Got it, my bad for going in circles on that. Let's focus.

So — Writing Beauty and Speaking Beauty, both launching together. What do you actually need to work on right now? Product spec, brand/positioning, or the app itself?

16:51:31 20/6/2026

now, let's first work on the branding, the feeling and then the app features

16:52:30 20/6/2026

Okay. Let's start with the feeling because that drives everything else — naming, UI, copy, feature decisions.

A few questions to anchor this:

16:52:36 20/6/2026

Q: What feeling do you want users to have when they open the app?

A: sth like anthropic

Q: Which direction feels right for the visual identity?

A: Minimal and clean — lots of white space, typography-forward

16:53:35 20/6/2026

Good reference point. Anthropic's feeling is basically: **serious without being cold, intelligent without showing off, calm without being boring**. The design does the credibility work so the copy doesn't have to.

For an IELTS app targeting Vietnamese learners that feeling is actually pretty rare — most competitors are loud, gamified, badge-heavy. A calm, typography-forward product would stand out immediately just by not doing what everyone else does.

Let me put together a brand direction board — feeling, visual language, tone of voice — so we have something concrete to react to before moving into features.

FEELING

Calm

not boring

Intelligent

not academic

Direct

not harsh

Spacious

not empty

COLOR DIRECTION

White — primary surface

#FFFFFF

Warm gray — secondary surface

#F1EFE8

Near-black — primary text

#2C2C2A

Purple — accent, feedback highlights

#534AB7

Teal — positive, improvement

#0F6E56

TYPOGRAPHY FEEL

Your essay has one problem.

The argument is there. The structure is what's breaking it. Here's where it goes wrong — and what to do about it.

Writing Beauty · Task 2 feedback

VOICE

Honest

Tells you what's actually wrong.
Doesn't soften the diagnosis.

Precise

One problem at a time. No
bullet-point avalanche.

Quiet confidence

Doesn't need to announce that
it's good. The quality speaks.

WHAT IT IS NOT

Not gamified — no streaks,
badges, or daily goals

Not a chatbot — structured, not
conversational

Not loud — no pop-ups, no
urgency, no red

That's the direction. A few things worth noting:

Purple as the accent because it reads as thoughtful and slightly premium without feeling corporate. Teal for anything positive — improvement, correct usage, Band 8 examples. The warm gray keeps it from feeling cold like a SaaS tool.

The "what it is not" section is as important as the rest. Most IELTS apps are anxious products — they make you feel behind. This one should feel like a space where you can think clearly.

Does this land? Anything you'd push back on before we move into features?

16:54:14 20/6/2026

im gonna use claude design to generate the branding system so can u help me fill out these

16:56:06 20/6/2026

Nice, Claude Design is a good call for this. Here's what to put in each field:

Company name and blurb:

Writing Beauty: a minimal, typography-forward web app that gives IELTS learners structured feedback on their writing — calm, intelligent, no gamification

Any other notes:

Anthropic-inspired aesthetic — serious without being cold. White primary surface, warm gray secondary, near-black text. Purple (#534AB7) as the main accent for feedback and highlights, teal (#0F6E56) for positive/improvement states. Clean sans-serif typography, generous whitespace, flat design with no gradients or shadows. The product should feel like a quiet, focused workspace — not an exam prep tool. Voice is honest and precise, one problem at a time.

Leave the GitHub, folder, fig file, and fonts fields empty for now — you don't have assets yet and Claude Design will generate from the description alone.

Once it generates, share what it comes up with and we can refine before moving into features.

16:56:13 20/6/2026

cool, now let's work on the features.

16:59:29 20/6/2026

Okay. Before we dive in, I need to understand what you actually want to build — because Writing Beauty and Speaking Beauty are quite different products.

Let me ask the most important question first:

16:59:34 20/6/2026

Q: Which one do we spec out first?

A: Writing Beauty only — get that right first

Q: What platform are you building for?

A: Web app (browser-based)

16:59:43 20/6/2026

Good. Now the core question for Writing Beauty specifically:

16:59:47 20/6/2026

Q: How does the user get their essay into the app?

A: actually i want sth different. i want this to be a place for them to practice: reasoning & polishing, and paste essay -> feedback should be a dedicated exercise.

Q: What's the business model?

A: free for now

17:01:27 20/6/2026

Okay that's a much more interesting product than just "paste and get feedback." You're building a **practice environment**, not a feedback tool.

So there are at least three distinct things the app does:

1. **Reasoning practice** — working on the argument before writing
2. **Polishing practice** — working on language after the argument is solid
3. **Essay feedback** — paste a finished essay, get a diagnosis

Before I map out the features, I need to understand what "reasoning practice" looks like in your head — because that's the most original part and I don't want to assume.

17:01:35 20/6/2026

Q: When a user does a 'reasoning' exercise, what are they actually doing?

A: i dont know yet. we need something that aligns with the traditional way of how they brainstorm and reasoning i just feel that this is necessary but still feel creative and transformative enough so they feel the transformation

Q: When a user does a 'polishing' exercise, what are they actually doing?

A: actually thats just a way of learning vocabulary. i will explain later

17:04:16 20/6/2026

Okay, let's park polishing for now since you'll explain that separately.

The reasoning exercise is the most important thing to get right — and you're right that it needs to feel transformative, not just another brainstorm template. Let me think out loud and you tell me if this is close:

Most Vietnamese IELTS students brainstorm by listing ideas — "point 1, point 2, point 3." The problem is that's just **topics**, not **arguments**. They never build the chain: claim → why it's true → what that means → so what. That's exactly the gap your 15-error taxonomy is about.

So what if the reasoning exercise is specifically designed to break that habit? Something like:

The user sees an IELTS prompt. Instead of a blank text box, they're given **a structured sequence of questions** that force them to build the A→B→C chain one step at a time:

- What's your position?
- Why is that true? (not just "because" — force a mechanism)
- What real-world example proves it?
- So what does that mean for the original question?

At the end they haven't written an essay — they've built an argument. Then the app shows them their chain visually so they can see whether it actually holds together.

The transformation moment is: *"I thought I had an argument. I actually just had an opinion."*

Does that direction feel right to you? Or is there a different kind of "transformation" you have in mind?

17:04:25 20/6/2026

but that's still guided. i mean like idk why but in exam condition, they have to brainstorm themselves. idk how to explain it, i mean i want that users after using will get better at reasoning, thinking indepth, in different perspective. this solves the problem "i don't know what to write" like they cant develop their argument

17:07:14 20/6/2026

Got it. So it's not about giving them a scaffold — it's about **training the thinking muscle** so that in exam conditions, they can generate depth on their own.

The real problem isn't "they don't know the steps." It's that **they can't see their own argument clearly enough to develop it**. They write one sentence and then stop because they don't know where to go next. They run out of "why."

So the practice isn't about guided scaffolding — it's about repeated exposure to the feeling of going deeper. Like a workout, not a worksheet.

Here's a direction worth reacting to:

The exercise gives them a prompt and a blank space. They write their argument however they naturally would. Then the app doesn't correct them — it **interrogates** them. Like a thinking partner that keeps asking "okay but why?" or "what would someone who disagrees say?" or "can you be more specific?" Not a template. A pressure that forces them to find more depth in what they already wrote.

Over time they internalize that voice. In the exam they start asking themselves those questions automatically.

The transformation is: *"I used to stop at my first thought. Now I can't."*

Does that feel closer? Or is the "interrogation" angle still too guided — you want something even more freeform?

17:07:21 20/6/2026

its not just transformative. it should also feel easy enough, like they can feel the transformation right away. just like this concept, this makes them retrieve their vocabulary right away, thats the aha moment previously, i have a concept where users r given the purpose of an paragraph, can chunks of information scattered, there will be distractors, useful chunks to achieve the purpose. basically they need to drag and drop the chunks into the pool and eventually, they need to check if the chunks they chose can actually help them or not.

17:13:15 20/6/2026

Okay NOW I see it. That's a really strong mechanic.

The screenshot is the key insight — **dịch câu** works because it makes retrieval feel like a game, and the "aha" is instant: you either know the word or you don't. No ambiguity. The transformation is immediate and satisfying.

Your drag-and-drop concept does the same thing for reasoning:

- You see a paragraph **purpose** (e.g. "argue that social media harms teenagers' mental health")
- You see a pool of **chunks** — some useful, some distractors
- You drag what you think supports the purpose

- The app tells you whether your selection actually achieves it

The "aha" moment is: *"I thought that chunk was relevant. It's actually a distractor."* That's the exact blind spot your students have — they can't tell the difference between an idea that sounds related and one that actually does argumentative work.

And it's low-stakes enough to feel easy. No blank page, no "I don't know what to write." Just: does this belong or not?

A few things I want to clarify before we build this out properly:

What are the chunks exactly — full sentences, ideas in a few words, or something else? And is the purpose shown as a plain statement, or as an IELTS-style prompt + position?

17:13:23 20/6/2026

NOOOO, i gave you what i did previously is that that approach has a fundamental problem. it feels forced and fixed while brainstorming is flexible. the concept is cool but it has a real freaking fundamental issue

17:15:28 20/6/2026

Ahhh okay — the problem is that drag-and-drop implies there's a **correct answer**, but real brainstorming doesn't work that way. There's no fixed set of "right chunks." Good reasoning can go in many different directions from the same prompt. So the mechanic creates a false constraint — it trains them to pick from a list instead of generating their own thinking.

So the real challenge is: how do you make an exercise that feels as instant and satisfying as dịch câu, but doesn't constrain the thinking into a fixed answer?

Is that the core tension you're trying to solve? Or is there something else about the drag-and-drop that felt broken to you?

17:15:33 20/6/2026

exactly the drag and drop feels instant and satisfying but it has that fundamental problem.

17:17:01 20/6/2026

Right. So the design problem is:

How do you get the "instant + satisfying" feeling of dịch câu without the "fixed correct answer" constraint of drag-and-drop?

Let me think out loud for a second. What makes dịch câu feel good is not really the drag-and-drop mechanic itself — it's the **immediate feedback loop**. You do something small, you find out right away if it worked. That's the dopamine hit.

The question is what the "small action" could be in a reasoning exercise that still has that instant feedback but doesn't have one correct answer.

One direction: instead of picking chunks someone else wrote, the user **generates a single sentence** — just one. Like "give me your 'because'" or "give me what someone who disagrees would say." The app doesn't judge it as right or wrong — it reflects it back in a way that makes the user themselves see whether it holds up. The feedback isn't "correct/incorrect," it's more like a mirror.

But I'm not sure that's satisfying enough yet.

Here's what I actually want to ask you: when you imagine a student finishing one exercise and feeling that transformation — **what specifically just happened to them?** What did they understand in that moment that they didn't before?

17:17:09 20/6/2026

what's the purpose of this? is to give them a skeleton? or what? we shall work on this

17:28:23 20/6/2026

Yeah you're right, let's work on this properly instead of going back and forth.

The fundamental question we need to answer first is: **what is the one thing the user walks away having practiced?**

Because right now we have two different possible purposes and they lead to completely different exercises:

Option A — Generating depth. They came in with a shallow argument. They leave having pushed it further than they would have alone. The skill is: "I can develop my own thinking."

Option B — Recognizing relevance. They came in unable to tell strong reasoning from weak reasoning. They leave able to spot the difference. The skill is: "I can judge whether an argument actually works."

Your drag-and-drop was Option B. The "interrogation" I suggested was Option A.

Which one is actually the gap your 800 essays showed you? When students write a bad Task 2 — is it more that they **can't generate enough** to fill the argument, or that they **generate the wrong things** without knowing it?

17:28:29 20/6/2026

im thinking of letting them deal with issues, like we show them an essay undone and they gotta develop it. but how to make it feels instant, satisfying?

17:32:50 20/6/2026

Okay that's a strong starting point — **complete the unfinished essay**. The student isn't staring at a blank page, they have something to push off from. That solves the "I don't know what to write" problem immediately.

But the "instant + satisfying" problem is still unsolved. With dịch câu, the feedback loop is maybe 10 seconds. With "develop this essay," the loop is... however long it takes to write, then wait for feedback. That's not instant at all.

So the question is: **what's the smallest possible unit of reasoning you can practice and get feedback on immediately?**

What if the "undone essay" isn't a half-written essay — it's a single argument with a **missing link**? Like:

"Social media causes depression in teenagers. Therefore governments should regulate it."

The A→C is there. The B — the mechanism, the why — is missing. The user's only job is to write **one sentence** that fills the gap. They submit. Feedback is instant because there's only one thing to evaluate: does your sentence actually connect A to C?

Small action. Immediate feedback. But completely open — no fixed correct answer, infinite valid responses.

The "aha" is: *"My sentence didn't actually connect them. I just restated A."*

Does that feel closer to what you're looking for? Or is even one sentence too constrained?

17:32:59 20/6/2026

excerpt_from_previous_claude_message.txt

not just unfinished essay, any issues that can happen inside an essay, maybe like logical jump, irrelevance whatever

17:33:57 20/6/2026

Ohh okay so it's more like — the essay has a **specific problem planted inside it**, and the user's job is to fix that one thing.

Not "finish this essay." More like **"this essay has a broken part — find it and fix it."**

So the exercise could be:

- A logical jump — the argument skips a step
- An irrelevant body paragraph — doesn't support the thesis
- A claim with no mechanism — states what but not why
- A paragraph that drifts — opens with one claim, evidence supports another

Each exercise is one essay, one planted problem, one fix. Small, focused, instant.

And the satisfaction comes from the same place as dịch câu — not "did I write a good essay" (too vague, too slow) but "did I correctly identify and fix this one specific thing" (clear, immediate).

The transformation is: they start seeing these problems in their own writing because they've been trained to spot them in others'.

This also maps directly onto your 15-error taxonomy. Each error type becomes an exercise type. You have a content library built in.

Is that the direction? And if so — does the user first **find** the problem, then fix it? Or do they just fix it directly?

17:34:06 20/6/2026

but only on the argument side.

and yes they gotta find the problem first, but the fix it mechanism is hard, how to make it instant & satisfying but still make them feel like they're actually writing just like the previous mechanism of retrieving vocab

17:35:51 20/6/2026

Right. So the find part is probably easier to make instant — they highlight or select the broken part, and the app confirms whether they found it. That's basically *địch câu* level feedback.

The fix part is where it gets hard. Because "write the fix" is open-ended and slow to evaluate. But "retrieve the right fix from options" feels forced and fake — back to the drag-and-drop problem.

What if the fix mechanic borrows more literally from *địch câu* — not drag and drop, but **reconstruct**?

Like: the app breaks the correct fixed version into **scrambled chunks** — not full sentences, just key phrases — and the user assembles them in the right order. They're still "writing" in the sense that they're making choices about what goes where and why. But the feedback is instant because there is a target sequence.

The difference from drag-and-drop is: they're not choosing *which ideas are relevant* — that was the broken mechanic. They're choosing *how to sequence and connect* ideas that are all relevant. The reasoning work is in the ordering and linking, not the selection.

The "aha" is: *"I had the right pieces but I put the mechanism before the claim" or "I skipped the link entirely."*

Does that feel like actual writing to you, or does it still feel too constrained?

17:36:00 20/6/2026

i dont get what u mean

17:37:22 20/6/2026

Sorry, let me be more concrete.

In dịch câu, the satisfying mechanic is: **you see a Vietnamese sentence, you reconstruct it in English word by word.** The retrieval IS the practice.

I was trying to apply the same logic to fixing an argument. But I think I overcomplicated it.

Let me come back to basics. In dịch câu:

- The **input** is clear: a Vietnamese sentence
- The **action** is clear: type the English version
- The **feedback** is instant: right or wrong

For the fix mechanic, what's the equivalent of "type the English version"?

Two honest options I can think of:

Option A — they rewrite the broken sentence. Input is one bad sentence. They type a better version. Feedback compares theirs to a model answer. Simple, but "comparing to model answer" might feel unfair for open-ended reasoning.

Option B — they complete a broken chain. Input is "A → ____ → C." They fill in just the missing B. One sentence. Feedback checks whether B actually connects A to C.

But honestly — you've seen 800+ essays and you know exactly what the fix moment feels like in real teaching. When you're sitting with a student and their argument is broken, what do you actually make them do to fix it?

17:37:30 20/6/2026

there r several ways but basically to write mechanism they need to find out the subjects and extract characteristics of the subjects that connect with the result, but that doesnt has anything to do with this freak

17:39:48 20/6/2026

Yeah you're right, that's a teaching method not a product mechanic.

Let me just be direct: I don't think I can solve the "fix it — instant + satisfying" problem by reasoning about it abstractly. We keep going in circles.

What might actually work better: **can you show me an example?**

Like — pick one broken argument from your 800 essays. Show me the broken part. Then tell me what you'd want the user to actually *do* on screen to fix it. Even if it's rough and half-formed, that's more useful than us theorizing.

17:39:52 20/6/2026

The expansion of multinational companies and the increase in globalisation produce positive effects for everyone.

To what extent do you agree or disagree with this statement?

(1) However, the expansion of multinational companies does not always benefit everyone. (2) In many developing countries, multinational corporations relocate their production facilities to developing countries where labour is significantly cheaper. (3) In these regions, labour regulations are often weak, which allows companies to reduce costs by paying extremely low wages and providing poor working conditions. (4) Consequently, many workers are employed in sweatshops where they work long hours with limited safety protection. (5) This situation shows that the pursuit of profit by multinational corporations can lead to unfair treatment of workers. (6) In addition, the presence of large multinational corporations can make it difficult for small local businesses to compete. (7) Because these global companies have greater financial resources and access to international markets, they can dominate the market and create a high barrier to entry for smaller firms. *(133 words)*

1/ Dựa vào câu (1), ta sẽ biết đoạn này triển khai về disbenefits of the expansion. Cá nhân mình không thích câu kiểu này lắm vì tốn chữ, không khác gì lặp lại thesis statement ở Intro.

2/ Ở câu (2), HV viết corps RELOCATE production facilities to developing countries. Mình hiểu ý HV, nhưng first instinct của mình sẽ là những corps này di chuyển vật lý cơ sở sản xuất của họ hả? Kiểu relocate Headquarters hay gì nghe hợp lý hơn.

3/ Từ câu (2) -> (3), HV dùng reference, refer COUNTRIES = REGIONS? Just weird. Lỗi này thường xuyên gặp hơn khi HV cố gắng paraphrase = synonyms.

4/ Vẫn trong câu (3), mình sẽ chờ đợi việc HV giải thích việc RELOCATE and/or CHEAP LABOUR thì sao, như thế nào, nhưng HV lại nói sang WEAK LABOUR REGULATIONS. Hơn nữa, HV cho việc weak regulations sẽ dẫn tới **companies** exploit employees? → Unconvincing, bị overgeneralisation. Và cả đoạn 'reduce costs....' rất kì nếu để vị trí giải thích cho câu (2). Câu (3) này vẫn có thể viết được nếu bạn tách ra thành 1 ý mới, giải thích CHEAP LABOUR FORCE riêng, và giải thích việc employees bị exploit riêng chứ không nên gộp lại thế này.

5/ Ở câu (4), HV dùng CONSEQUENTLY để chỉ mối quan hệ nhân quả, nhưng câu (3-4) đâu phải mối quan hệ đó. Vì những chỗ làm có weak regulations nên nhân viên đi làm/được tuyển ở những chỗ đó? Câu này cũng chẳng có ý nghĩa gì ngoài việc lặp ý câu (3). Đây là ví dụ điển hình của việc 'T biết từ này, template tới đây là phải sử dụng từ này nên t phải sử dụng' chứ không tập trung vào mạch ý của câu.

6/ Câu (5) dùng để tie up idea 1 trong đoạn. Viết câu (5) này lên làm topic sentence còn ok hơn câu (1).

7/ Câu (6) là về Idea 2 với Claim là big fish eat small fish. Claim được giải thích là big fish có nhiều tiền và access to international marketS → dominate **the** market (which one?) + create a barrier for small fish. Ý này tuy ngắn và chưa thuyết phục lắm, nhưng lại ổn hơn idea 1. Idea 1 chiếm nhiều chữ và thời gian quá nhưng banh xác. |

the issue is in the 6 and 7 sentence where this idea is underdeveloped or more correctly logical jump, how come financial resources & access to international market -> dominate the market & high entry barrier
i want them to explain the mechanism here, just that

17:42:52 20/6/2026

Okay NOW I see it clearly.

The broken chain is:

Big financial resources + international market access → [missing mechanism] → dominate market + high entry barrier

The user's job is to write **just that one missing middle sentence**. Nothing else.

And the satisfying feedback is: the app evaluates whether their sentence actually **connects** the two ends. Not right/wrong — more like "does this bridge hold?"

That's your mechanic. It's basically dịch câu but for logic:

- **dịch câu**: here's a meaning, retrieve the English form
- **Writing Beauty**: here's a broken chain, retrieve the missing link

The action is tiny — one sentence. The feedback is instant. But the cognitive work is real — you have to actually understand the mechanism to write it. And there's no fixed answer, just a test of whether the bridge holds.

The exercise template is:

1. Show the essay context (so they understand the argument)
2. Highlight the broken jump — sentence 6 → sentence 7
3. **"What's missing here? Write one sentence that connects these two."**
4. Instant feedback: does it bridge the gap?

Does this feel like it finally clicks? And do you want to now map out what the full exercise flow looks like on screen?

17:43:01 20/6/2026

but that doesn't feel instant, i mean like the previous mechanism, they know what they're doing like they got anchored vietnamese text but this one is opening, idk man

17:45:14 20/6/2026

Yeah I get it. The problem is **there's no anchor**.

In dịch câu the Vietnamese sentence is the anchor — you always know exactly what you're trying to produce. The target exists, you just have to retrieve the form.

In "write the missing link" — there's no anchor. It's open space. That's what makes it feel slow and uncertain, not instant.

So the question is: **what could be the anchor for a reasoning exercise?**

In dịch câu the anchor is a meaning in another language. What's the equivalent for an argument mechanic — what already exists that the user is trying to retrieve or reconstruct?

I genuinely don't know the answer to this. You're closer to it than I am because you've watched 800 students struggle with exactly this moment.

When a student finally writes a good mechanism sentence — what did they just **see** that they didn't see before?

17:45:21 20/6/2026

maybe first find the error -> options (with plausible distractors) -> the options r just rough thought not academic one, mimic their thought when brainstorming -> polishing. i guess this

17:49:28 20/6/2026

Okay that's it. That's the full mechanic:

1. **Find the error** — they read the paragraph, identify where the jump is. This is the anchor. Now they know exactly what they're working on.
2. **Choose the rough thought** — options given, plausible distractors included. Not academic sentences, just raw brainstorm-level ideas. Like how you'd actually think it before writing it. This is the *dịch câu* moment — instant, anchored, satisfying. They're not generating from nothing, they're recognizing the right thinking.
3. **Polish it** — now they take that rough thought and write it properly as an IELTS sentence. This is where the actual writing happens, but it's no longer scary because they already know what they're saying.

The genius of this is the **separation of "what to say" from "how to say it."** Most students conflate these two problems and get paralyzed. This mechanic forces them apart.

And each step has its own instant feedback:

- Step 1: did you find the right place?
- Step 2: did you pick the right thought?
- Step 3: did your sentence actually express that thought?

Does that feel complete to you? Or is there something still off about one of the steps?

17:49:36 20/6/2026

actually the polishing will be exactly like the retrieving i gave u above

17:50:49 20/6/2026

Ohhhh. So polishing IS the dịch câu mechanic — literally.

The full loop is:

1. **Find the error** — locate the logical jump in the paragraph
2. **Choose the rough thought** — multiple choice with distractors, pick the right mechanism in plain brainstorm language
3. **Polish it** — given the rough thought in Vietnamese, retrieve the academic English version word by word, exactly like dịch câu

So the whole exercise is three steps, each with instant feedback, each building on the last. And step 3 solves the vocabulary problem at the same time as the reasoning problem — they're learning how to *express* the mechanism they just identified.

That's a complete, elegant mechanic. And it maps perfectly onto your two app pillars — reasoning and polishing aren't separate features, they're **the same exercise**, just different steps.

Shall we now sketch out what this looks like on screen — the actual UI flow?

17:50:55 20/6/2026

actually the rough thought is not vietnamese, its english and its the anchor text for polishing. i want them to think in english

17:51:27 20/6/2026

Ohh okay so the flow is:

1. **Find the error** — locate the jump
2. **Choose the rough thought** — pick the right mechanism in rough English (e.g. *"big companies got more money so they can cut prices and smaller ones can't keep up"*)
3. **Polish it** — that rough English sentence IS the anchor, now retrieve the academic version of it word by word, dịch câu style

So it's not Vietnamese → English. It's **rough English** → **academic English**.

Which is actually better for your goal of making them think in English. The anchor is still concrete enough to feel like dịch câu, but the cognitive work is now purely in English — no translation happening, just upgrading the register and precision.

And the rough thought in step 2 naturally sounds like how a student actually thinks, so it feels familiar and accessible. Then step 3 forces them to find the academic form of something they already understand.

Clean. Shall we move to the UI flow now?

17:51:33 20/6/2026

yep thats it. or maybe we just get rid of the find the error phase

17:53:00 20/6/2026

Yeah that makes sense. Finding the error is a separate skill — more diagnostic. What you've built here is specifically about **developing the argument**, not spotting problems.

So the core exercise is just two steps:

1. **Choose the rough thought** — given context + the gap, pick the right mechanism from options
2. **Polish it** — take that rough thought, retrieve the academic version word by word

Clean, fast, repeatable. Every exercise is one logical gap, two steps, done in maybe 2-3 minutes.

And you can layer complexity over time — early exercises have obvious distractors, later ones have distractors that are close but logically wrong in subtle ways.

Ready to sketch the UI flow?

17:53:05 20/6/2026

now what about the organizing?

17:54:49 20/6/2026

Good question. So we have reasoning and polishing covered. Organizing is the middle layer — structure — which is what you said the audience is blind to.

But before we go there: what does "organizing" mean in your head for this app? Because it could be a few different things:

- **Sentence level** — how information flows from one sentence to the next (thematic progression, given/new)
- **Paragraph level** — how the parts of a body paragraph are ordered (claim, explain, example, link)
- **Essay level** — how the whole argument is structured across paragraphs

Which layer are you thinking about? Or all three?

17:54:54 20/6/2026

I dont know man. All r necessary, how r we going to structure them?

18:29:29 20/6/2026

Okay let me think about this differently.

You have three layers of organizing problems:

- **Sentence level** — information flow between sentences
- **Paragraph level** — parts in the right order
- **Essay level** — whole argument holds together

But here's the thing — your reasoning exercise already covers a lot of the paragraph and essay level implicitly. When they practice filling logical gaps, they're learning how a paragraph is supposed to flow.

So maybe the question isn't "how do we teach all three layers" but rather **"what does the student actually feel confused about that organizing exercises would fix?"**

From your 800 essays — when a paragraph feels disorganized, what's usually the actual problem? Is it more:

A — they have the right ideas but in the wrong order

B — they don't know what's supposed to come after what (don't know the paragraph structure at all)

C — sentences don't connect to each other even if the ideas are right

Because A, B, and C are completely different exercises. And I'd rather nail one than spread thin across all three.

18:29:36 20/6/2026

maybe A, there r often some theme drift and referencing issue, non-linear development, emphasis-slot is wrong like the chunk r placed at the wrong attetion slot position

18:31:35 20/6/2026

Okay so the organizing problem is specifically:

- Right ideas, wrong order
- Theme drift — sentence opens with unexpected information, reader loses the thread
- Referencing issues — "it/this/they" pointing to the wrong thing or nothing
- Non-linear development — consequence before cause, effect before mechanism
- Wrong emphasis slot — important information buried in the middle instead of end

These are all **arrangement** problems, not generation problems. The ideas exist, they're just placed wrong.

So the mechanic could be much simpler than reasoning. Because the anchor is already there — **the sentences themselves**. The user isn't generating anything new, they're **reordering and reconnecting** what exists.

Which actually makes it closer to drag-and-drop — but this time it doesn't have the fundamental problem you identified earlier, because there IS a correct arrangement. Theme-rheme flow, given-new structure, emphasis slots — these have real rules. It's not open-ended like argument development.

So the exercise could be:

1. Given scrambled sentences — put them in the right order
2. Given a paragraph with a wrong referent — fix it
3. Given a paragraph with buried emphasis — move the right chunk to the end

Each one is small, concrete, instant feedback.

Does that feel right? Or is reordering still too mechanical — too far from real writing?

18:31:44 20/6/2026

okay fine. and then eventually there will be one more polishing phase huh?

18:33:01 20/6/2026

Yeah exactly. So the full picture of Writing Beauty is actually three exercise types:

Reasoning — find the logical gap, choose the mechanism, polish it to academic English

Organizing — reorder scrambled sentences, fix referents, fix emphasis slots

Polishing — pure dịch câu mechanic, Vietnamese-style retrieval but rough English → academic English

And they're not random — they follow the same top-down logic as your assessment philosophy:

Fix the argument first → then the structure → then the language

So a user could either do them as standalone practice sets, or eventually you could chain them — one essay, three phases, same top-down order.

That's actually the Writing Builder mechanic you already prototyped, just now expressed as exercises rather than a feedback tool.

Shall we now map out the full app structure — what screens exist, how a user moves through it?

18:33:07 20/6/2026

but for organizing specifically, i mean how come we show them the differences between position? like how come we show hierarchy, thats the design problem

18:34:18 20/6/2026

Yeah that's the hard design problem. Because the difference between:

*"Many students struggle with writing. **This** affects their grades."*

and

*"Many students struggle with writing. **Their performance** is therefore affected."*

...is subtle. The words are almost the same. But the emphasis, the theme, the information flow — completely different. How do you make that *visible* on screen in a way that feels instant and clear?

I don't have a good answer right now honestly. This is a visual design problem that probably needs actual experimentation — trying different ways to highlight, annotate, or animate the difference until something clicks.

But before we solve the how — do you think organizing should be its own separate exercise type? Or should it be woven into the reasoning exercise naturally, since you can't really fix a logical gap without also thinking about how the sentence sits in the paragraph?

Because if it's woven in, maybe you don't need to visualize hierarchy explicitly — the user just feels it through the mechanic itself.

18:34:25 20/6/2026

yep, it should be a dedicated exercise.

18:39:10 20/6/2026

Okay so organizing is its own exercise type. The design problem of making hierarchy and position *visible* is real and unsolved.

I think this one we can't spec properly in the abstract. It needs a prototype — try a few different visual approaches and see what actually makes the difference feel obvious.

So let's park organizing for now with a flag: **needs visual prototyping before we can spec the mechanic properly.**

What we have confirmed so far for Writing Beauty:

Reasoning — fully specced. Two steps: choose rough thought → polish to academic English.

Organizing — direction clear, mechanic TBD, needs visual prototyping.

Polishing — fully specced. Pure dịch câu mechanic, rough English → academic English word by word.

Essay feedback — paste essay, get diagnosis. Separate dedicated exercise.

Does this feel like a complete enough picture to start thinking about the app structure and screens? Or is there something missing at the feature level before we go there?

18:39:16 20/6/2026

excerpt_from_previous_claude_message.txt

still i feels weird. Like what if the the error is something that's not just fill in the gap one? Maybe it's to redefine like the reasoning is false itself. I mean what if that's the case? You know why mean how I mean the issue is not just a logical jump, the issues can be whatever. I mean I don't know how to explain this, but freak.

20:58:01 20/6/2026

Yeah I hear you. We've been designing the exercise around one specific error type — the logical jump, the missing mechanism. But reasoning errors are way more varied than that:

- The claim itself is just wrong or too weak
- The example doesn't actually support the claim
- The whole paragraph is arguing the wrong thing relative to the thesis
- The reasoning is circular — restating instead of explaining
- The position is contradicted later in the essay

And for each of these, "choose rough thought → polish" doesn't work. There's no missing link to fill in. The problem is deeper — the whole direction is wrong.

So maybe the two-step mechanic isn't **the** mechanic for all reasoning exercises. It's just the mechanic for **one type** — missing mechanism.

Which means you might need different exercise formats for different error types. And that's actually fine — dịch câu doesn't have one exercise format either, it has many question types serving the same goal.

The question becomes: **what are the 3-4 most common reasoning errors from your 800 essays**, and what does fixing each one actually look like as an action?

You already have the 15-error taxonomy. Which Layer 1 errors show up most?

20:58:10 20/6/2026

I mean like maybe just maybe we will let them to find out the errors and then yeah we'll have several options for them to like choose and then come to the final phase where they have to publish it in the target language maybe in this case like the semi-academic one. Yeah, I guess so.

21:00:02 20/6/2026

Okay so the mechanic is actually more universal than I thought:

1. **Find the error** — they read the paragraph, identify what's wrong. Not just logical jumps — any reasoning error.
2. **Choose the fix direction** — options given, not "what's the missing mechanism" but "what's the right way to fix this specific problem." Distractors included.
3. **Polish** — express the fix in semi-academic English, dịch câu style.

And step 2 is flexible enough to handle any error type — whether it's a missing mechanism, a false claim, a circular argument, whatever. The options just reflect different fix directions for that specific problem.

So the mechanic is actually one unified loop. Find → Choose → Polish. Works for all reasoning error types.

And you just solved your own problem — you were trying to make one mechanic fit all errors, and the answer was to make step 2 the flexible part. The options carry the error-specific logic, not the mechanic itself.

That's clean. Shall we lock this in and move to the app structure?

21:00:10 20/6/2026

excerpt_from_previous_claude_message.txt

And maybe just maybe the options to choose will just be like the direction like okay so for example you need to um kinda like fix these fallacies or you need to like fix this weak warrant and we'll give them the direct direction okay you should do maybe you should just analyze it this find out this and then yeah find one they have to like okay sketch out everything and polish it themselves and give them feedback I don't know if that's good or not I mean it may go against with the instant and satisfying principle we have stated above but I don't know I mean this is the only way I don't know if this is the only way or not but right now I think this is the only way you can be against that

21:03:22 20/6/2026

Yeah I hear you — and I won't fight it.

Because honestly the "instant + satisfying" principle was always in tension with the fact that reasoning is genuinely hard and open-ended. You can't fully gamify deep thinking without losing the depth.

So maybe the principle needs to be updated. Instead of:

instant + satisfying at every step

It becomes:

instant at diagnosis, satisfying at the end

Meaning:

1. **Find the error** — instant. The paragraph is right there, they identify it.
2. **Get the direction** — instant. Options tell them what kind of fix is needed. *"Your warrant is weak — you need to explain why this cause actually leads to this effect."*

3. **Write the fix themselves** — slow, open, real writing. No shortcuts.
4. **Get feedback** — satisfying. AI evaluates whether their fix actually solved the problem.

The satisfaction isn't in every micro-step anymore. It's in the moment when the feedback says "*yes, that fixed it.*" That's still a powerful payoff — maybe more meaningful than dịch câu because they actually wrote something real.

The dịch câu mechanic stays for **polishing** where instant + satisfying fully works. But for **reasoning**, depth wins over instant.

Does that tradeoff feel acceptable to you?

21:03:29 20/6/2026

Just one thing, I mean like this single exercise has a lot of steps to get the to get where we want it to be. Um just asking if like if it's a little bit too like okay so you know famous apps focus on what it should focus on like okay it will have only one single mechanism for I mean like it's simple, that's it. But so the the question is that are we overcomplicating things? Like okay maybe the users will get into this exercise and they are presented with okay go and find out the errors and then they they get options to choose and then they got to fix it and then they got feedback. I mean there are a lot of steps going on. I don't know how to explain this but fuck.

21:06:12 20/6/2026

Yeah you're right to flag this. Four steps is a lot. It starts to feel like a workflow, not an exercise.

The best apps do one thing. Duolingo: translate this. dịch câu: retrieve this. One action, one feedback. That's it.

So maybe the question is — **which single step gives the most value?**

Because if you had to pick just one:

- **Find the error** — trains diagnosis
- **Choose the direction** — trains error recognition
- **Write the fix** — trains actual reasoning
- **Get feedback** — the payoff

The writing + feedback pair is probably the most valuable. Everything before it is scaffolding.

So maybe the exercise is just: **here's a broken argument, fix it, get feedback**. No find, no options, no direction. Just write and find out.

The "instant" feeling comes from the feedback being fast and precise — not from micro-steps along the way.

But then you lose the anchor. Back to the blank page problem.

So honestly — I think you have two real options:

Option A — Simple, one action, lose some scaffolding, trust the user more

Option B — Keep the steps but make them feel like one fluid experience through design, not separate stages

Which direction feels more like the product you want to build?

21:06:21 20/6/2026

I guess I'll go for option A but I mean that's that's just some abstract thought we are having right now so can you just okay direct one simple prototype for me like just make it live make it live out here so we can see if it matches or if it feels good for users or not because I believe that for those who actually want to improve their writing they will not they will not mind spending like five minutes to fix an argument just to improve their writing I mean yeah.

21:08:32 20/6/2026

Let me build a live prototype right now.

IELTS PROMPT

The expansion of multinational companies and the increase in globalisation produce positive effects for everyone. To what extent do you agree or disagree?

1 Read the argument

In addition, the presence of large multinational corporations can make it difficult for small local businesses to compete. **Because these global companies have greater financial resources and access to international markets, they can dominate the market and create a high barrier to entry for smaller firms.**

2 Fix the argument

The highlighted part jumps straight to the result without explaining *how* financial resources and market access actually lead to market domination. Write one or two sentences that fill this gap.

e.g. With vast capital, multinationals can afford to price products below cost for extended periods, forcing smaller competitors out...

0 words

Submit fix

Need a hint?

Try it — write something in the box and hit submit. The feedback is live AI evaluation.

This is the simplest possible version: one broken argument, one task, one feedback. No steps, no scaffolding. Just fix it and find out.

Tell me what feels right and what feels off.

21:09:18 20/6/2026

So basically it's just a bite-sized learning, is that what you mean?

21:10:29 20/6/2026

Yeah exactly. One broken argument, one fix, two minutes max. Repeat.

The learning compounds over time — not because the app is tracking your streak or giving you badges, but because you've fixed 50 broken arguments and your brain starts seeing them automatically in your own writing.

Same logic as dịch câu. Nobody learns vocabulary from doing it once. You do it 200 times and the retrieval becomes automatic.

So the product is really just: **a well-curated library of broken arguments + that one mechanic + honest AI feedback**. That's it. The simplicity is the product.

Does that feel right to you? Or do you feel like something's still missing before we move to the app structure?

21:10:35 20/6/2026

Yeah, that's it, but now next uh next problem, which is organizing. So we got this sort of like, okay, argument stuff, and then we got this um vocabulary stuff, we got it, but then this organizing stuff which is the hardest thing, we can still leave untackled

21:12:52 20/6/2026

Yeah leave it for now. It's the hardest design problem and you don't want to block the whole product on it.

Ship with two exercise types — reasoning and vocabulary. Organizing becomes v2 once you've had real users and can prototype the visual mechanic properly.

So the MVP is:

Reasoning — broken argument, fix it, get feedback

Vocabulary — rough English → academic English, dịch câu style

Clean, buildable, coherent. Shall we move to the app structure now?

21:12:56 20/6/2026

Okay, I noticed this pattern so like okay when there's this product like this AI scoring wherever it is okay users have this kinda like pattern where they wanna share their score and that that that that that that that that that that means it has word word of mouth effect which is really really really really really really really really really really cool. Just asking if we can design this in a way that can trigger this sort of like word of mouth wherever it is. I mean I don't know how to explain that.

21:15:08 20/6/2026

Yeah I get it completely. The shareability is baked into the score — people naturally want to show off a Band 7.5 or feel validated by "your argument had a logical jump here." It's the same reason people share their Wordle results or their Spotify Wrapped.

The key insight is: **what's the thing worth sharing?**

For Writing Beauty it's probably not a score — scores are everywhere, everyone has a score. What's more interesting and shareable is the **diagnosis**. Something like:

"Your biggest writing problem is: you explain what, never why."

That's specific, slightly painful, and true. People share things that feel uncomfortably accurate about themselves.

So the shareable artifact could be a **writing profile** — after enough exercises, the app builds a picture of your specific error pattern. Not "Band 6.5" but "you consistently drop the mechanism in your second body paragraph" or "your claims are strong but your examples never connect back."

That's something worth screenshotting and posting. Because it's about *you*, not just a number.

And it naturally drives word of mouth because when someone sees it they think — *"wait, I want to know what mine says."*

Does that direction feel right? Or do you have a different shareability moment in mind?

21:15:17 20/6/2026

Well, I think of something different. Maybe some sort of like transformative stuff. Um like okay there will be this paragraph or this essay got these errors, got these arguments, false is and all that in this essay, which is closely related to task task response score. You gotta improve it, you gotta fix it, okay and then we got we show them, you know like the screen of the how the score got improved. Maybe a task response criteria got improved from band five to like band eight or whatever you call it. I mean maybe.

21:16:57 20/6/2026

Ohh that's much better. The shareability moment is the **transformation**, not the diagnosis.

Like a before/after. The essay came in broken, you fixed it, and now the screen shows:

Task Response: Band 5 → Band 8

That's the screenshot moment. It's satisfying, it's visual, it's proof that *you* did something. Not the app — you.

And it works because it's earned. You actually had to fix the argument to get there. The score change is the reward for real work, not just a number the app gave you.

It also maps perfectly to your brand POV — most IELTS tools give you a score. Writing Beauty shows you how the score *moves* when you fix the right thing.

The word of mouth writes itself: *"I fixed one logical gap and my Task Response went from 5 to 8, try this."*

Two things to figure out before we build this:

1. Is the score change happening at the exercise level (one fixed argument = score improves) or essay level (submit whole essay, fix issues, see overall improvement)?
2. Is the scoring AI-generated or based on your taxonomy criteria — because the credibility of that Band 5 → Band 8 claim depends entirely on how trustworthy the scoring feels.

Which one do you want to tackle first?

21:17:05 20/6/2026

Um actually I mean okay users have to fix the whole thing like the whole essay but the score only give score on the on the targeted criteria which is target response or cohesion coherence whatever it is you know. It should not give the overall score which is which will be you know really dissatisfying because what if users organizing skills are so freaking bad? What if users vocabulary and grammar and all that are so freaking bad as well, you know.

21:19:55 20/6/2026

Yeah that's smart. You isolate the criteria that the exercise actually targets.

So if the exercise is about argument — you only show Task Response score change. If it's about organizing — only Coherence & Cohesion. The user isn't penalized for skills they haven't practiced yet.

It's honest AND motivating at the same time. They see real improvement in the thing they worked on, without being crushed by everything else they haven't touched.

And it makes the shareable moment even cleaner:

Task Response: Band 5 → Band 8

"Fixed the logical gaps in this essay"

No overall score. No noise. Just: you worked on this one thing, here's what moved.

This also means each exercise type has its own score:

- Reasoning exercises → Task Response
- Organizing exercises → Coherence & Cohesion
- Vocabulary exercises → Lexical Resource

Each one a separate before/after. Users can see exactly which skill is moving and which isn't.

Shall we now lock everything we have and sketch the full app structure — what screens exist, how a user moves through the product?

21:20:03 20/6/2026

Now what if we do the same thing for organizing?

21:39:20 20/6/2026

Same mechanic — user fixes the organizing issues in an essay, and only the Coherence & Cohesion score moves. Before → after. Shareable moment.

But we're back to the unsolved problem: **what does the fixing action actually look like for organizing?**

Because for reasoning, fixing = writing a better argument. Clear action.

For organizing — is the user rewriting sentences? Reordering them? Fixing referents manually? That interaction still isn't designed.

So the question is the same one we parked earlier: do you want to tackle the organizing mechanic now, or keep it as v2 and ship reasoning + vocabulary first with the before/after score moment?

21:39:27 20/6/2026

I mean it just okay we got we give them the what what what what what what what what what what what feels off in the essay we highlights and ask them okay how are you and you how are you going to fix it and they write their version and that's that's it.

21:40:36 20/6/2026

Yeah that works. Same mechanic as reasoning actually:

Here's what feels off — highlighted. Write your fix. Get feedback + score change.

So all three exercise types share the same core loop:

See the problem → Write the fix → See the score move

The difference is just what's highlighted and what criteria scores changes:

- Reasoning → logical gaps highlighted → Task Response moves
- Organizing → theme drift, wrong referent, bad emphasis highlighted → Coherence & Cohesion moves
- Vocabulary → weak/wrong language highlighted → Lexical Resource moves

Same mechanic, three flavors. That's a really clean product.

And now organizing isn't a design problem anymore — the highlighting does the visual work of showing what's wrong. You don't need to visualize hierarchy abstractly. You just point at it.

Shall we move to the app structure now?

21:40:43 20/6/2026

But then we okay now we need to like define all kind of all kinds of problems that can happen at these two axes and then we need to define a way to give feedback explanation I mean yeah like we should give it on what should like on what what what what what what what what what what criteria I mean I don't know how to explain that but we should give feedback in a more structured way. Instead of just some generic stuff we need to give feedback. I don't know how to explain that fuck.

21:47:08 20/6/2026

Yeah I get it. The feedback can't just be "good try, but your argument needs more development." That's useless.

The feedback needs to be **diagnostic** — tied to a specific error type, explaining exactly what went wrong and why, not just that something went wrong.

Which you already have. Your 15-error taxonomy is exactly this. Each error has:

- A name
- Why it's wrong
- What to do instead
- The linguistics behind it

So the feedback engine isn't generic AI — it's AI that's **constrained to your taxonomy**. When a user submits a fix, the feedback references the specific error type from your framework. Not "your coherence could be better" but "this is a Brand New Theme jump — your sentence opens with information the reader hasn't been introduced to yet."

Plain language at the surface, your taxonomy doing the work underneath.

So before we go further — do you want to now map all the error types across the three exercise axes and define what good feedback looks like for each one? That becomes the feedback spec the AI runs on.

Basically turning your 15-error taxonomy into a feedback rubric. That's the core intellectual work that makes Writing Beauty different from every other AI writing tool.

Want to do that now?

21:47:17 20/6/2026

But then we have have this all? I mean like we got all these um errors, we got um all these errors, we got taxonomy that we will feedback on and how the feedback should look like.

21:52:23 20/6/2026

Yeah we already have most of it actually. From everything we've built together:

The errors — 15-error taxonomy across 3 layers, fully defined.

The feedback structure per error — already specced: name the error → reader experience → linguistics explanation → fix → takeaway. That's the newsletter annotation format but it works perfectly as in-app feedback too.

The criteria mapping — just defined: reasoning errors → Task Response, organizing errors → Coherence & Cohesion, vocabulary errors → Lexical Resource.

What we don't have yet is the **exercise content** — the actual broken essays and highlighted problems that users practice on. That's the content library problem. Someone has to curate or generate the exercises.

But structurally — the feedback engine is basically already specced. We just need to take your existing taxonomy and annotation format and turn it into a system prompt that constrains the AI.

So honestly we're closer than it feels. The intellectual work is done. What's left is:

1. App structure and screens
2. Content library — who makes the exercises
3. The system prompt that makes feedback feel like your taxonomy, not generic AI

Want to move to app structure now and come back to those three?

21:52:32 20/6/2026

But I think there's this one thing, that is the don't know what to write error that we haven't worked on. Like okay, users have written the thesis, but they don't know what to write next, that's a problem. I mean I think our library of errors are still missing very bad. I mean yeah, I dunno.

21:53:39 20/6/2026

Yeah you're right. "I don't know what to write" isn't in the taxonomy because it's not really a language error — it's a **pre-writing problem**. It happens before the essay even exists.

The 15-error taxonomy captures what goes wrong *in* the writing. But this is what goes wrong *before* the writing — the blank page after the thesis.

And this is actually what your reasoning exercise is designed to solve. The user practices filling logical gaps, building mechanisms, developing arguments — so that when they sit down to write, they have something to say.

So it's not a missing error type. It's the **reason the reasoning exercise exists**.

But I think what you're pointing at is something slightly different — that the taxonomy might be missing some argument-level errors that explain *why* students get stuck. Like:

- They have a position but no supporting line of reasoning
- They have a point but can't develop it beyond one sentence
- They repeat the same idea across multiple paragraphs without realizing

Are these the kinds of gaps you're feeling are missing? Because if so, we should probably do a proper audit of the Layer 1 errors before we build the feedback engine — make sure the taxonomy actually covers everything that can go wrong at the argument level.

Want to do that audit now?

21:53:47 20/6/2026

Yeah, I mean I think the most like what uh the the our library of errors are mostly extracted from a fully written essay which cannot picture f fully picture the the pain points of users when writing. I mean like okay when they write when they write the first sentence they are stuck on what to write next that that causes that choppy sentence error. I mean yeah. So our exercise can be can hit at these pain points. I mean I don't know. that that pain points happen when they write. I don't know how to explain that to you, but hopefully you'll get what I mean.

21:56:02 20/6/2026

Yeah I get it completely.

The taxonomy was built by looking at **finished essays** — so it captures errors as they appear in the final product. But it doesn't capture the **moment the error was born** — which is when the writer was sitting there not knowing what to write next.

Like choppy sentences — in the essay it looks like a structure error. But the real cause is the writer finished one sentence, had no idea what came next, and just started a new standalone thought. The error is a symptom. The pain point is the blank moment between sentences.

So the taxonomy describes **what went wrong**. But your exercises need to target **why it went wrong** — the actual stuck moment.

That's a different lens entirely. And it probably means some errors in your taxonomy have a different root cause than they appear to have on the surface.

Which is actually a really important insight for the feedback engine too — if the feedback only addresses the surface error without touching the underlying stuck moment, the user fixes this essay but gets stuck the same way on the next one.

So maybe what's missing isn't more error types — it's a second layer to each error: **what was the writer trying to do when this went wrong?**

That would make the feedback actually preventive, not just corrective.

Is that what you're feeling is missing?

21:56:11 20/6/2026

Yep, exactly.

21:57:15 20/6/2026

Okay so this is actually a significant piece of work — rethinking the taxonomy from the writer's perspective, not the reader's perspective.

Right now every error is described from the **reader's experience** — what it feels like to read a broken essay. But we need to also map the **writer's experience** — what it feels like to be stuck at that exact moment.

So each error gets a second dimension:

What the reader sees: choppy sentences, no subordination

What the writer felt: "I made my point, I don't know what to add so I just started a new sentence"

What the reader sees: logical jump, missing mechanism

What the writer felt: "I knew where I wanted to end up but didn't know how to get there"

What the reader sees: argument drift

What the writer felt: "I started writing and the evidence took me somewhere else"

This changes the feedback completely. Instead of just "here's what's wrong and how to fix it" — the feedback first **names the stuck moment** so the user recognizes themselves in it. That's what makes feedback feel true rather than generic.

This is probably a full working session on its own — going back through all 15 errors and mapping the writer's pain point behind each one.

Do you want to do that now, or lock the product direction first and come back to it?

21:57:23 20/6/2026

excerpt_from_previous_claude_message.txt

Or maybe they just just just they just they like they automatically assume that readers know that know the missing link, I know or their mind is too fast.

21:58:45 20/6/2026

Yes. That's much more accurate than "they didn't know how to get there."

It's not that they're stuck — it's that they **don't notice the gap exists**. Their brain filled it in automatically. They know the connection so well that it feels obvious, so they never write it down.

The reader's brain doesn't have that context. So it reads as a jump.

That's a completely different problem. It's not a writing skill gap — it's a **perspective gap**. They can't see their own essay the way a stranger reads it.

And that changes what the exercise needs to do. It's not teaching them *how* to develop an argument. It's teaching them to **notice what they left out** — to read their own writing as if they don't already know what they meant.

Which is also why the "find the error" step matters so much. Not to test them — but to train that exact skill: seeing your own blind spots.

This probably applies to several errors in the taxonomy, not just logical jumps. "I thought it was obvious" is likely the hidden cause behind:

- Missing inferential bridge
- Underdeveloped chain
- Vague referents
- Argument drift

They all share the same root: **the writer's mental model is more complete than what they actually wrote.**

Should we flag this as the core insight that reframes the whole taxonomy audit?

21:58:54 20/6/2026

Basically we have to rework again the readers perspective should only be on the feedback. I mean we should approach the exercise from writer perspective and the feedback should be from readers perspective. You know what I mean right? Writers have their own pain points. Readers have their own have their own pain points and if we understand these two things integrate them into this I mean hopefully it will work out eventually. I dunno if you understand why me or not.

22:01:29 20/6/2026

Yeah I understand completely.

Writer's perspective → drives the exercise design. What was the writer trying to do? Where did they get stuck? What did they assume? That's how you make the exercise feel real and recognizable — users see themselves in it.

Reader's perspective → drives the feedback. Here's what your reader actually experienced. Here's where they got lost. Here's what they needed that you didn't give them.

The exercise meets them where they are. The feedback shows them the consequence.

That's actually a really elegant teaching loop:

"You assumed the reader knew X" → exercise hits that exact moment → "here's what your reader felt when they hit that gap" → feedback closes the loop

And it works because both sides are true at the same time. The writer isn't wrong for thinking what they thought. The reader isn't wrong for getting lost. The exercise makes both perspectives visible simultaneously.

This is the thing that makes Writing Beauty different from every other feedback tool. Other tools only have the reader's perspective — "this is wrong, fix it." Writing Beauty has both — "here's why you wrote it that way, and here's what happened on the other side."

That's the core intellectual product.

So the taxonomy audit we need to do is actually two columns per error:

Writer's pain point — what they were thinking/feeling/assuming

Reader's experience — what the reader hit as a result

Shall we do that audit now? It's probably the most important work before anything else gets built.

22:01:39 20/6/2026

Yeah, watch we need to j audit now, I mean yeah we need to focus on the Ryos pain point first especially just specifically for IOS running.

22:03:07 20/6/2026

Got it — writer's pain points specifically for the reasoning exercises (Layer 1 errors only).

Let me pull up the Layer 1 taxonomy and do the audit properly.

Used tool ▾

🔑 Searching project

✓ Done

Good. I have the taxonomy in memory. Let me do the audit now — Layer 1 errors only, writer's pain point mapped for each one.

LAYER 1 — ARGUMENT ERRORS · WRITER VS READER PERSPECTIVE

1 Underdeveloped chain

Missing warrant/mechanism — $A \rightarrow C$ with no B

WRITER'S PAIN POINT

"I know this is true, everyone knows this is true. Why do I need to explain it?"

READER'S EXPERIENCE

The argument feels asserted, not proven. Reader is left doing the writer's work.

1b Non-linear order

Ideas present but sequenced wrong — consequence before cause

WRITER'S PAIN POINT

"I wrote down my ideas as they came to me. The result felt obvious so I put it first."

READER'S EXPERIENCE

The conclusion appears before the reasoning. Reader can't follow the logic forward.

2 Missing inferential bridge

Implicit link left unstated — writer assumed reader would connect the dots

WRITER'S PAIN POINT

"The connection was obvious in my head. My mind moved too fast to write it down."

READER'S EXPERIENCE

Two sentences sit next to each other with no visible connection. Reader feels a jolt.

3 Argument drift

Paragraph opens with one claim, evidence supports a different one

WRITER'S PAIN POINT

"I started writing and my example took me somewhere else. I didn't notice I'd moved."

READER'S EXPERIENCE

The paragraph promises one thing and delivers another. Reader feels misled.

4 Redundant topic sentence

Repeats thesis, adds no new macro-proposition

WRITER'S PAIN POINT

"I didn't know how to start the paragraph so I restated what I already said. It felt safe."

READER'S EXPERIENCE

The paragraph adds no new ground. Reader feels the essay is marking time.

5 Perspective drift

Inconsistent hedging or stance across the essay

WRITER'S PAIN POINT

"I wasn't sure how strongly to commit, so I hedged sometimes and went absolute other times without realizing."

READER'S EXPERIENCE

The writer seems to contradict themselves. Reader loses trust in the position.

That's the full Layer 1 audit. Two things I want to flag:

Errors 1 and 2 share almost the same writer pain point — "I assumed the reader knew." They might actually be the same root cause expressed differently. Worth thinking about whether they need to be separate exercise types or collapse into one.

Error 4 — redundant topic sentence — the writer pain point is really "I didn't know how to start." That's the blank page problem you mentioned earlier. The fix isn't just "write a better topic

sentence" — it's teaching them what a topic sentence is *supposed to do* that's different from a thesis.

Does this mapping feel accurate to what you see in your students? Anything that feels off or missing?

22:03:49 20/6/2026

But still there's this issue that they don't know what to write next. That's the that's I think that's the biggest issue for writers when they write

22:05:20 20/6/2026

Yeah. And looking at this audit — that pain point isn't captured by any single error. It cuts across all of them.

"I don't know what to write next" is the moment *before* the error appears. It's the cause behind multiple errors:

- They don't know what comes after the claim → underdeveloped chain
- They don't know how to start the paragraph → redundant topic sentence
- They start writing and follow wherever it goes → argument drift
- They finish a sentence and just start a new disconnected one → choppy sentences

So it's not a new error to add to the taxonomy. It's the **underlying generative problem** that the taxonomy symptoms all point back to.

Which means the exercise library needs a specific category for this — not "fix this broken argument" but **"continue this argument."** The essay stops mid-development. The user has to figure out what comes next and why.

That's a different exercise type from fixing. Fixing assumes something exists and is wrong. Continuing assumes something exists and is incomplete — which is closer to the actual writing experience.

So maybe the exercise library has two modes:

Fix — something is broken, find it, repair it

Continue — something is unfinished, figure out what comes next

And "continue" directly trains the "I don't know what to write next" muscle without any scaffolding. Just: here's where the writer stopped. What would you do?

Does that feel like the missing piece?

22:05:30 20/6/2026

1. Fix — something is broken, identify and rewrite it. Covers: logical jump, missing bridge, perspective drift.

3. Stay on track — the argument drifts away from the paragraph's main point mid-way. User has to identify where it goes off and rewrite to stay relevant. Covers: argument drift, irrelevance.

And each one hits a different stuck moment:

- Fix → "I wrote something wrong without knowing"
- Continue → "I didn't know what to write next"
- Stay on track → "I followed my example instead of my claim"

Shall we lock this as the reasoning exercise spec and move forward?

22:07:31 20/6/2026

Do you have any suggestion?

22:08:30 20/6/2026

Yeah, one thing I keep thinking about.

All three exercise types assume the user is working on **other people's writing**. Which is good for learning — less ego involved, easier to see clearly. But at some point they need to transfer that skill to their own writing.

So maybe there's a fourth mode — not a separate exercise type, but a **final boss** version: they write a paragraph from scratch given only a topic sentence, and the app evaluates it against all three dimensions — is it developed, does it stay on track, does the chain hold?

That's the moment where everything they practiced actually gets tested. And it's also the shareable score moment — not fixing someone else's essay, but their own paragraph improving over time.

The other thing I'd flag: right now the three types are sequenced by what went wrong. But users don't know which type they need. So the app either needs to let them choose, or — better — **diagnose their weakness first** and serve them the exercise type they actually need most.

Like a short initial assessment: here's a paragraph, what would you do with it? Based on how they respond, the app knows whether their gap is developing, continuing, or staying on track. Then it serves them a personalized queue.

That makes the product feel intelligent rather than just a library of exercises.

Worth building in from the start, or too complex for v1?

22:08:39 20/6/2026

I believe that the fourth mode you mentioned has already been handled, which is the full a essay writing simulation, that's it.

22:10:16 20/6/2026

Yeah you're right, that's already covered. The full essay writing simulation is exactly that — write from scratch, get evaluated on everything. I overcomplicated it.

And the diagnosis idea — worth keeping in mind for later but probably too complex for v1. Start with the three exercise types, let users pick what they want to practice, see what they actually gravitate toward. Real usage data will tell you more than any upfront assessment.

So the reasoning spec is locked:

Fix → broken argument, rewrite it

Continue → topic sentence + mini conclusion given, fill the middle

Stay on track → argument drifts, identify where and rewrite

Full essay simulation → separate feature, write from scratch, full evaluation

Clean. Shall we move to the full app structure now, or is there anything else at the feature level before we go there?

22:10:22 20/6/2026

Okay, that's fine. Now next to the organizing.

22:11:29 20/6/2026

Okay. Same approach — three questions before we spec it.

We already agreed the mechanic is: highlight what feels off → user rewrites → feedback + Coherence & Cohesion score moves.

The errors we identified earlier were: theme drift, wrong referents, non-linear development, wrong emphasis slot.

So the question is — do these need different exercise types like reasoning did? Or is one mechanic enough for all of them?

Because theme drift and wrong referents feel very different from each other as actions:

- Wrong referent → user fixes one word or phrase. Very surgical.
- Theme drift → user rewrites a whole sentence to reposition the information. More substantial.
- Wrong emphasis slot → user moves a chunk to the end. Almost structural.

They're all "organizing" problems but the fixing action is completely different each time.

Do you want to treat them as separate exercise types — like you did for reasoning — or keep it as one unified "fix the organizing problem" exercise where the highlighted error tells the user what kind of fix is needed?

22:11:37 20/6/2026

What I mean is that we need to approach these organizing errors from writers perspective. That's it.

22:12:46 20/6/2026

You're right, I jumped ahead. Let me do the same audit we did for Layer 1 — organizing errors from the writer's perspective first, before we design anything.

From what we identified: theme drift, wrong referents, non-linear development, wrong emphasis slot.

Let me think through each one:

Theme drift

Writer: "I was just writing the next thing that came to mind. I didn't realize I'd switched subjects."

Wrong referents

Writer: "I used 'it' or 'this' because I thought it was obvious what I was referring to. It was clear to me."

Non-linear development

Writer: "I wrote the consequence first because that's what felt most important. The cause felt like background."

Wrong emphasis slot

Writer: "I didn't know that where you put information in a sentence changes what feels important. I just wrote it naturally."

Looking at these — three out of four share the same root cause as Layer 1: **the writer doesn't realize the reader doesn't share their mental model**. They can see their own meaning clearly so they don't notice what's missing or misplaced.

The only genuinely different one is emphasis slot — that's not about assuming shared knowledge, it's about **not knowing the rule exists at all**.

Does this mapping feel accurate to you? And does it change how you think about the exercise design?

22:12:54 20/6/2026

One more thing I wanna add is the misuse of connectives. Like okay, these two sensors may have this cause and effect order but they use a wrong connective maybe. Wait what if that's the case?

22:14:56 20/6/2026

Yeah that's a real and common one. The writer knows there's a relationship between two sentences — cause and effect, contrast, addition — but they grab the wrong connective to express it.

Writer's pain point: "I knew these two ideas were connected. I used 'however' or 'therefore' because it sounded academic. I didn't think about whether it actually matched the relationship."

It's a different kind of problem from the others. Not "I didn't realize the reader couldn't follow" — but "I knew the relationship but reached for the wrong word to express it." Almost a vocabulary problem but specifically about logical connectives, not general lexis.

Which means it sits in an interesting place — it's technically a Layer 2 error (connector misuse, error 8 in your taxonomy) but the writer's pain point is a reasoning problem: they didn't think clearly enough about what kind of relationship they were expressing.

So from the exercise design perspective — does this belong in organizing exercises or reasoning exercises? Because if the user doesn't understand the logical relationship between two sentences, fixing the connective won't help. They need to understand the relationship first, then choose the right word.

What do you think — is it a standalone exercise type or does it fold into one of the existing ones?

22:15:04 20/6/2026

So with all of that errors, what kind of exercises should we design? The mechanism

22:15:43 20/6/2026

Okay let me map all the organizing errors to their writer pain points first, then figure out what exercise mechanism actually fits.

The errors:

- Theme drift → "I just wrote the next thing, didn't notice I switched subjects"
- Wrong referents → "It was obvious to me what 'it' referred to"
- Non-linear development → "I wrote the consequence first because it felt most important"
- Wrong emphasis slot → "I didn't know where information sits in a sentence changes what feels important"
- Connector misuse → "I knew two ideas were connected, I just grabbed the wrong word"

Looking at these together — the writer's pain point splits into two distinct groups:

Group A — awareness problem. They didn't notice something was wrong. Theme drift, wrong referents, non-linear development. They need to be shown the gap between what they wrote and what the reader experienced.

Group B — knowledge problem. They didn't know a rule existed. Emphasis slot, connector misuse. They need to learn something first before they can fix anything.

And that suggests two different exercise mechanisms:

For Group A — show them the broken paragraph, show them the reader's experience side by side, ask them to rewrite. The contrast IS the teaching moment.

For Group B — more like a pattern recognition exercise first. Here are two sentences — what's the relationship? Now choose the right connective. Or: here's a sentence — where does the important information sit?

Does that split feel right to you?

22:15:51 20/6/2026

The Group A is totally good, but the Group B that feels too guided idk.

22:19:28 20/6/2026

Yeah I get it. "Here are two sentences, what's the relationship, now choose" — that's basically a grammar exercise. Feels like a textbook, not a real writing experience.

But the problem with Group B is real — if they don't know the rule exists, you can't just throw broken writing at them and expect them to fix it. They'll rewrite it wrong and not know why the feedback says it's still off.

So the question is — how do you teach a rule without it feeling like a lesson?

One thought: what if the rule is never explicitly stated? Instead they see the broken version and the fixed version side by side, no explanation, just — "here's what a good writer did differently." They have to figure out why it works better themselves.

The insight comes from comparison, not instruction. Like noticing a pattern rather than being told a pattern.

But I'm not sure if that's satisfying enough or instant enough.

What does your gut say — when a student genuinely doesn't know that emphasis slots exist, what's the most natural way they'd discover that?

22:19:35 20/6/2026

Maybe we should do go for the approach of the group A. We show them how the writer how the reader feels and then tell them, Okay, you go and fix it and then we give them hints where it is, you know.

22:21:17 20/6/2026

Yeah that works. Same mechanic for everything — no special treatment for Group B.

So the full organizing exercise is:

Show the broken paragraph → **show how the reader feels** — confused, lost, jolted — in plain language, no jargon → **hint pointing to where the problem is** → **user rewrites** → **feedback + Coherence & Cohesion score moves**

The "reader feels" part is doing the teaching work for Group B without it feeling like a lesson. They don't need to know what an emphasis slot is. They just need to feel: "the reader got confused here, something about how I placed this information threw them off." Then the hint points them to the right spot.

The rule emerges from the experience, not from instruction.

And it's the same loop as reasoning — writer perspective going in, reader perspective as feedback. Consistent across the whole product.

So now we have:

Reasoning — Fix / Continue / Stay on track — 3 exercise types

Organizing — one unified mechanic, reader experience + hint + rewrite

Vocabulary — rough English → academic English, dịch câu style

Shall we move to the full app structure now?

22:21:25 20/6/2026

Like we are going for this sort of like bite size writing, you know. every modes is small, they practice one by one, that's it.

22:22:15 20/6/2026

Yeah exactly. Bite-sized, one problem at a time, done in 2-3 minutes, repeat.

The whole product is basically a **writing gym**. You don't go to the gym and do everything at once. You isolate one muscle, train it, come back tomorrow.

Reasoning session → one broken argument, fix it, done.

Organizing session → one broken paragraph, feel the reader confusion, fix it, done.

Vocabulary session → one rough sentence, retrieve the academic version, done.

Small reps, consistent practice, skill compounds over time.

And the full essay simulation is the match day — where everything trained separately gets used together.

That's a really clean product philosophy. Shall we move to app structure now?

22:22:20 20/6/2026

That's it, but for the feedback we still keep it?

22:22:38 20/6/2026

Yeah keep the feedback. The feedback is what makes each rep actually teach something rather than just being a test.

Without feedback it's just: did I get it right or wrong. With feedback it's: here's exactly what your reader experienced and why your fix worked or didn't. That's the difference between practice and deliberate practice.

The feedback just needs to be short and sharp — two or three sentences max. Not a lecture. More like a coach whispering in your ear after each rep.

Okay, app structure now?

22:22:42 20/6/2026

i mean the structure of the feedback

22:23:19 20/6/2026

Right. Same structure across all exercise types:

What the reader felt → **why it happened** → **what your fix did** (or didn't do)

Three sentences. Plain language. No jargon at the surface.

For example after a reasoning fix:

"Your reader hit a wall here — the jump from cause to result left them doing the logical work themselves. That happened because the mechanism — how one leads to the other — was assumed rather than stated. Your fix named the mechanism explicitly, which closes the gap."

Short, specific, tied to the reader experience. Not "good job" or "needs more development."

Same structure works for organizing and vocabulary — just the "what the reader felt" changes depending on the error type.

Lock that in?

22:23:25 20/6/2026

yep. since we r gonna use AI for that, maybe write a prompt template for those.

22:23:46 20/6/2026

Good call. Let me write the prompt templates for all three exercise types.

Ran command, presented file ▾

📄 Create the prompt templates file

📄 Presenting file(s)...

✓ Done

Four templates — one per exercise type. Each one slots in the variables from the exercise so the feedback is always specific, never generic.

The key constraint in every template is the three-sentence structure: reader experience → why it happened → what the fix did. That's what keeps AI feedback feeling like your taxonomy rather than generic praise.

Ready to move to app structure?

writing_beauty_feedback_prompts
Md

22:24:39 20/6/2026

okay that's it for now. so Can you generate a comprehensive example from the material, the passage, to the user's response to the feedback?

22:26:05 20/6/2026

Which exercise type do you want the example for?

22:26:09 20/6/2026

Q: Which exercise type?

A: Reasoning — Fix

22:27:57 20/6/2026

IELTS PROMPT

The expansion of multinational companies and the increase in globalisation produce positive effects for everyone. To what extent do you agree or disagree?

READ THE PARAGRAPH

In addition, the presence of large multinational corporations can make it difficult for small local businesses to compete. **Because these global companies have greater financial resources and access to international markets, they can dominate the market and create a high barrier to entry for smaller firms.**

WHAT THE WRITER WAS THINKING

"I knew financial resources lead to market dominance — that felt obvious. I didn't think I needed to explain how."

YOUR TASK

WHAT TO FIX

The highlighted sentence jumps from "financial resources + market access" straight to "dominate the market." The reader is left wondering: how exactly does having more money lead to domination? Rewrite the highlighted part so the mechanism is explicit.

STUDENT'S RESPONSE

Because these global companies have greater financial resources and access to international markets, they are able to sustain prolonged periods of below-cost pricing, flooding local markets with cheaper goods until smaller competitors, unable to absorb such losses, are forced to exit the industry. Once local businesses have been driven out, multinationals can raise prices and consolidate their dominance, leaving little room for new entrants who lack the capital to compete on the same scale. This ultimately creates a high barrier to entry for smaller firms.

FEEDBACK

TASK RESPONSE

Band 5 → Band 7.5

That's the complete flow — passage, writer's pain point, task, student response with the fix highlighted in green, feedback, and score change.

A few things worth noting: the fix is highlighted in green so it's immediately clear what changed. The feedback traces exactly why it worked — not generic praise. And the score jump from 5 to 7.5 is the shareable moment.

Does this feel like the right direction?

22:30:27 20/6/2026

vietnamese please, didn't we made it clear that?

22:31:30 20/6/2026

My bad. Let me redo it in Vietnamese.

Xong rồi. Toàn bộ flow bằng tiếng Việt — đề bài, đoạn văn, người viết đang nghĩ gì, nhiệm vụ, bài làm của học viên, phản hồi, và điểm số. Cảm thấy ổn chưa?

22:32:13 20/6/2026

That's good. The only thing I wanna change is the passage feels too isolated. Maybe we should give them a full paragraph, for example, or even full essay, I dunno.

22:33:26 20/6/2026

Yeah that makes sense. Right now the exercise feels like a grammar drill because the broken sentence is floating in isolation. If they see the full paragraph or essay first, they understand the argument's intent — what the writer was trying to do globally — which makes the broken part feel like a real writing problem, not a textbook exercise.

Full paragraph or full essay though — which one? Because there's a tradeoff:

Full paragraph → enough context to understand the argument, fast to read, keeps the exercise bite-sized.

Full essay → maximum context, closest to real exam conditions, but heavier to read before even starting the exercise.

My instinct is full paragraph for most exercises, full essay only for the simulation mode. But you know your students — do they need the whole essay to understand what went wrong, or is one paragraph enough?

22:33:32 20/6/2026

Yeah, maybe full paragraph is fine for now.

22:35:17 20/6/2026

Got it. Let me redo the example with the full paragraph shown first.

22:35:57 20/6/2026

Cool. Now for the UI of these exercises specifically, because I have built out the you know all the wireframes and all that for the page, I just need a dedicated I just need to see the UI, how the UI should look for these exercises page specifically.

22:38:38 20/6/2026

Got it. Before I build it — a few quick questions so I design the right thing:

22:38:42 20/6/2026

Q: Which device are we designing for?

A: Desktop only

Q: How should the paragraph and task be laid out?

A: I don't know. We got r readers thoughts on the on the errors. We got t to let users write, we got the paragraph, how should we structure it depends on you.

22:39:57 20/6/2026

Okay let me think about this properly before designing.

We have four elements to show at once:

1. **The paragraph** — needs to be readable, errors highlighted
2. **Writer's thought** — context for why the error happened
3. **Reader's experience** — what went wrong from the reader's side
4. **The write box** — where they fix it

The natural reading flow is: understand the context → see what went wrong → fix it. So left-to-right or top-to-bottom should follow that logic.

My instinct: **two-column layout**. Left column is read-only — the paragraph, writer's thought, reader's experience. Right column is action — the task description and write box. Left is "understand," right is "do."

This way the paragraph stays visible while they write their fix. They don't have to scroll back up to reread — it's always there. That matters because good fixing requires constantly referring back to the original.

Let me build it.

ĐỀ BÀI

The expansion of multinational companies and the increase in globalisation produce positive effects for everyone. To what extent do you agree or disagree?

ĐOẠN VĂN

In addition, the presence of large multinational corporations can make it difficult for small local businesses to compete. In many developing countries, multinational corporations relocate their production facilities to regions where labour is significantly cheaper. In these regions, labour regulations are often weak, which allows companies to reduce costs by paying extremely low wages. Consequently, many workers are employed in sweatshops where they work long hours with limited safety protection. This situation shows that the pursuit of profit can lead to unfair treatment of workers. **Because these global companies have greater financial resources and access to international markets, they can dominate the market and create a high barrier to entry for smaller firms.**

NGƯỜI VIẾT NGHĨ GÌ

"Mình biết có nhiều tiền thì sẽ thống trị thị trường — điều đó hiển nhiên mà. Không cần giải thích thêm."

NGƯỜI ĐỌC CẢM NHẬN GÌ

NHIỆM VỤ

Phân tô màu nhảy thẳng từ "có nhiều tiền" sang "thống trị thị trường" mà không giải thích cơ chế. Viết lại phần đó sao cho người đọc hiểu được tại sao một dẫn đến kia.

Two-column layout — left side is read-only context (đề bài, đoạn văn, writer's thought, reader's experience), right side is the action (task + write box). Feedback slides in at the bottom spanning full width after submission, with the score card sitting to the right of the feedback text.

The paragraph stays visible the whole time they're writing — they never have to scroll back up to reread.

Try writing something and submitting — the feedback is live. What feels off?

22:41:08 20/6/2026

I don't know, this still feels like finding a fixed one. This does this does not illustrate the real process of writing. Actually, what skills that we are training train on is reasoning. That means users have to reason to to reason. Like, is not this fixed? Okay, I mean they have to reason. I don't know how to explain that, but I mean yep. Also there's this one thing I've been thinking about lately is that how can we make this app distinctive from others like others are just scoring and receive feedback and I think that's that's what we're going for, I mean.

09:25:31 21/6/2026

Yeah I hear both things you're saying and they're actually the same problem.

The UI right now looks like a correction exercise — here's a broken thing, fix it. That's not reasoning. That's editing. The user is reacting to someone else's mistake, not actually thinking through an argument themselves.

And that's exactly what makes it look like every other IELTS app — input text, get feedback, done.

The difference you want is: **the user is doing the thinking, not the fixing**. The broken paragraph is a prompt to reason, not a thing to repair.

So maybe the framing is completely wrong. Instead of:

"This sentence has a logical jump. Fix it."

It should be:

"This paragraph is trying to argue X. Does it succeed? Where does it fall apart? What would you say instead?"

The user isn't a proofreader. They're a thinker being asked to reason through the same problem the writer faced — and arrive at a better answer themselves.

The broken paragraph is just a starting point. The real exercise is: **can you build the argument correctly where this writer couldn't?**

That reframe changes everything — the task, the UI, the feedback, the feeling.

Does that feel closer to what you mean?

09:25:43 21/6/2026

No, this is a writing one. I want them to write, not thinking that's it. I mean they have to write this phase where they have to think to reason. I we have to make their reason out there. I mean I dunno how to explain that but fuck frick

09:26:55 21/6/2026

Okay let me try to understand this differently.

Right now the exercise says "here's the broken part, rewrite it." The user fixes one sentence. That's too surgical — it doesn't require them to actually reason, just patch.

What you want is: they have to **produce the reasoning themselves**. Not fix a broken sentence. Actually write the argument — the claim, the why, the mechanism — from their own thinking.

So maybe the exercise isn't "fix this highlighted part" but more like:

The paragraph stops right before the reasoning needs to happen. They see the setup. They have to write what comes next. The thinking has to come from them, not from reacting to someone else's mistake.

Is that closer? Like — the exercise cuts the paragraph at the exact moment where reasoning is required, and the user has to continue from there?

09:27:04 21/6/2026

Yeah, I think or something like that, like we give them the thesis and the final mini conclusion, how they feel in the the in the middle I mean in their own simple language, like just just make it make it out there You dont have to be perfect, you dont have to be perfect in your language or the order of it just make it out there, I mean that's it. But the problem is that how can we make them f think that okay they ne they can make it raw, they can they they can make it uh imperfect. How can we tell them that they they can do it? That's the problem, I mean.

09:29:36 21/6/2026

Yeah. The barrier isn't ability — it's **permission**. They're so trained to write perfectly that they freeze before they even start. The blank box feels like a test, not a thinking space.

So the UI itself has to communicate: **this is a rough draft space, not an exam**.

A few ways to signal that:

The text box looks different — not a clean formal input but something that feels more like a notepad. Maybe slightly off-white, lined, casual.

The placeholder text does the work — not "Write your answer here" but something like "*Cứ viết đại ra đi, sai cũng được, miễn là có ý...*" That one line changes the whole psychological contract.

The label above the box says something like "**Ý thô**" — rough thoughts. Not "your answer." Not "your essay." Just: what's in your head right now.

And critically — the feedback never judges the language. Only the reasoning. So even if they write in broken English or half Vietnamese half English, the feedback responds to the *thinking*, not the *writing*. That has to be explicit in the UI somehow — "Chúng mình chỉ quan tâm đến ý, không quan tâm đến câu chữ."

The permission has to be built into the design, not just said once in an onboarding screen.

Does that feel like the right direction?

09:29:45 21/6/2026

Yeah, actually I'm thinking of something like that. Like the thesis and the mini conclusion also are really simple. Maybe some just thoughts language, a mixed language, whatever it is, just make it simple as possible so they can feel the register and then okay they will adapt to it. I mean that's a rough idea. But still I believe that I there there's still one problem. I mean like okay they got it they got the thesis they got they know what the task is but they I just my hypothesis is that they may fall fall back to this sort of like brainstorming process where they just produce the main ideas not some depth of it like they will not provide depth of the ideas because this they they think this is brainstorming but actually it's not you know what I mean

09:31:44 21/6/2026

Yeah I get it exactly.

The thesis and mini conclusion give them the destination. But without guardrails, they'll just list the stops — "firstly this, secondly that" — instead of actually building the road between them.

They default to breadth because that's what brainstorming taught them. Cover the points, move on. But what you want is depth — one idea, pushed all the way through.

So maybe the constraint IS the solution. Instead of giving them a blank space between thesis and conclusion, you give them **one specific question** that forces depth:

Not "write what goes in the middle" but something like:

"Tại sao điều này xảy ra? Cơ chế là gì?"

Just that one question. In casual language. No format, no structure, no word count. Just: answer this one thing as deeply as you can.

The question blocks the breadth instinct because there's nothing to list — you can only go deeper on one thing.

And if they still go shallow, the feedback doesn't say "good try." It asks the same question back: "*Ừ nhưng tại sao? Cái gì khiến điều đó xảy ra?*"

The exercise teaches the "tại sao" reflex — which is exactly the diagnostic question you said is at the heart of your whole teaching philosophy.

Does that feel like it solves the depth problem?

09:31:53 21/6/2026

But how do we market this? I mean this is our unique selling point, but how do we market this?

09:35:26 21/6/2026

That's actually a really clean USP to market because it's **tangible and provable**.

Most IELTS apps say "improve your writing." You can say something more specific:

"Luyện tập cách lập luận, không chỉ sửa câu."

Or even simpler:

"Biết viết câu đúng rồi. Giờ học cách có ý để viết."

That second one hits the exact pain point — your audience already knows grammar, already knows vocabulary. What they're missing is the thinking. That's the gap nobody else is addressing.

The marketing moment is actually already inside the product. When someone finishes one exercise and their Task Response goes from Band 5 to Band 7.5 — that's the screenshot. That's the thing they share. Not "I learned about logical jumps." But "I fixed my argument and my score jumped."

The word of mouth does the marketing work.

But honestly — I think you're asking a bigger question than just tagline. You're asking: **how do we make people understand that their writing problem is a thinking problem, before they even try the app?**

And that's exactly what the newsletter was supposed to do.

Which brings everything full circle — the newsletter under your personal brand isn't separate from the app. It's the marketing engine for it. It installs the pain, the app delivers the solution.

Does that connect for you?

09:35:36 21/6/2026

Then comes the organizing. Fuck.

09:37:58 21/6/2026

Haha yeah organizing is the hard one.

Same question as reasoning though — right now the exercise is "here's a broken paragraph, fix the organizing." But that's still reactive. The user is editing, not organizing.

The real skill you want to train is: **can you feel when information is in the wrong place?**

Which is actually a reading skill before it's a writing skill. You have to feel the jolt — the moment the reader loses the thread — before you can fix it.

So maybe the exercise starts from the reader's experience, not the broken paragraph. Like:

"Độc đoạn này. Có chỗ nào bạn phải đọc lại không?"

No highlighting. No hint. Just: read it and notice where you stumble. That moment of stumbling IS the skill being trained.

Then once they've felt it themselves — now they rewrite.

The difference from reasoning is: reasoning trains "do you have enough to say." Organizing trains "can you feel how information flows."

But I'm going to stop here because I think there's a deeper problem — organizing exercises risk feeling like grammar drills no matter how you frame them. Theme drift, referents, connectors — these are all very mechanical when isolated.

So maybe the question is: **should organizing be a standalone exercise type at all, or should it be woven into the reasoning exercise naturally?**

What do you think?

09:38:07 21/6/2026

What do you mean by woven into the reasoning exercise?

09:39:20 21/6/2026

Like — when the user writes their rough reasoning in the reasoning exercise, the feedback doesn't just evaluate the logic. It also flags if the information flow is broken.

So they're not doing two separate exercises — reasoning exercise, then organizing exercise. They're doing one thing: write the argument. And the feedback responds to both dimensions at once.

"Ý của bạn đúng rồi — cơ chế rõ. Nhưng câu thứ hai bắt đầu bằng thông tin mới trong khi người đọc vẫn chưa xử lý xong câu trước. Thử đảo lại xem."

The organizing feedback emerges naturally from the writing, not from a separate drill.

The advantage is it feels like real writing — because in real writing you don't think "now I'll fix my logic, now I'll fix my flow." You just write and everything happens at once.

The disadvantage is it might be too much feedback at once for a beginner. They're already struggling with the reasoning — adding organizing on top might overwhelm.

So the question is really about your user's level. Are they:

Beginner — needs one thing at a time, separate exercises make sense

Intermediate — ready to handle both dimensions in one exercise, woven feedback works

Which one is your primary user?

09:39:29 21/6/2026

Also previously the depth I mean was the hierarchy of information.
So that means with the rough sketch out of information, it's not enough to assess their organising skill, that's it, that's the problem.

09:42:13 21/6/2026

Yeah exactly. The rough sketch-out is flat by nature — they're just getting ideas out. There's no sentence structure, no information packaging, no given-new flow. You can't assess organizing from a brain dump.

Organizing only shows up when they're writing actual sentences. Because organizing IS about how information sits inside sentences and moves between them — that requires real syntax, not rough thoughts.

So the two exercises are necessarily separate:

Reasoning exercise — rough, flat, messy is fine, just get the logic out

Organizing exercise — has to be at the sentence level, because that's where organizing problems actually live

Which means organizing can't be woven into reasoning. They operate at different levels of the writing process.

But that brings back the original problem — organizing exercises feel like drills because you're isolating sentence-level mechanics.

The only way around that is if the organizing exercise uses a **full paragraph the user already wrote** — not someone else's broken paragraph. Their own output becomes the material.

So maybe the flow is:

1. Reasoning exercise → they produce rough ideas
2. They write it up into a proper paragraph
3. Organizing exercise → their own paragraph gets assessed for flow

That way organizing never feels abstract. It's always about **their own writing**, their own sentences, their own choices.

Does that flow make sense?

09:42:21 21/6/2026

Isn't that just a feedback loop?

09:44:28 21/6/2026

Yeah you're right. That's just the essay feedback feature we already have — write something, get feedback on it. Not a dedicated exercise.

So organizing as a standalone exercise type is still unsolved. We keep hitting the same wall: either it feels like a grammar drill, or it collapses into feedback.

Maybe the honest answer is — organizing can't be trained in isolation the same way reasoning and vocabulary can. It's too embedded in actual sentence production to extract into a clean bite-sized mechanic.

So maybe for v1 you just have two exercise types:

Reasoning — train the thinking

Vocabulary — train the language

And organizing gets handled through the essay feedback feature — when users submit full paragraphs, the feedback flags organizing issues in context. Not a separate exercise, just part of the feedback layer.

Organizing becomes v2 once you've watched real users long enough to see if there's a clean mechanic hiding in there.

Does that feel like the right call?

09:44:35 21/6/2026

for vocabulary exercise, gimme 1 example

09:58:53 21/6/2026

TỪ VỰNG · NÂNG CẤP CÂU

LEXICAL RESOURCE

Bài 6 / 10

NGỮ CẢNH — ĐOẠN VĂN GỐC

In addition, the presence of large multinational corporations can make it difficult for small local businesses to compete. Because these global companies have greater financial resources, they can sell stuff cheaper for a long time until small companies have to give up and leave the market. This ultimately creates a high barrier to entry for smaller firms.

CÂU THỎ CẦN NÂNG CẤP

"they can sell stuff cheaper for a long time until small companies have to give up and leave the market"

Ý đúng rồi. Giờ nói lại cho academic hơn — chọn từ theo thứ tự bên phải.

CHỌN TỪ THEO THỨ TỰ ĐỂ HOÀN THÀNH CÂU

Chọn từ bên dưới theo thứ tự...

they are able to sustain sell
prolonged long periods of
below-cost cheap pricing,
forcing pushing smaller
competitors companies out
of the market.

Xoá hết

Kiểm tra

Đây rồi. Cùng layout hai cột — bên trái là ngữ cảnh và câu thô, bên phải là chọn từ theo thứ tự dịch câu style.

Distractors có trong đó — "sell" thay vì "sustain," "long" thay vì "prolonged," "companies" thay vì "competitors," "pushing" thay vì "forcing." Tất cả đều plausible nhưng sai về collocation hoặc register.

Feedback thay đổi tùy theo mức độ đúng — hoàn toàn đúng, gần đúng, hay sai nhiều.

Cảm thấy ổn chưa?

09:59:57 21/6/2026
